PAVEMENT / ASPHALT CORING

Pavement / asphalt coring is a method used to study the quality of pavements / asphalt and gain insight to what lies beneath the surface.

It involves taking small cylindrical samples, called cores, from the pavement / asphalt to check its composition, strength, and thickness.

The information gathered from these cores helps determine the condition of the pavement / asphalt and plan for any necessary repairs or upgrades.

CORE SAMPLE

This process is done with a special drilling machine and is quick and non-invasive, making it a useful tool for those who maintain and improve pavements / asphalt.
